LAB - PSEUDOCODES

LAB-12

Manelcha Verma MR

265HSBDO15

```
1. int get numbers (n)
{
    for (n = 0 to 10)
    {
        print n
        n = n + 1
    }
}
```

```
2. int get Even Even Number (n)
{
    for (n = 0 to 50)
    {
        if (n % 2 == 0)
        {
            print (n)
        }
    }
}
```

```
3. int print get Multiplication Table (int n, int val)
{
    num = val
    for (n = 0 to 15)
    {
        print (n * num)
        n = n + 1
    }
}
```

```

4. int getDoubleTheElement (int[] numbers,
    {
        read numbers < nums.txt
        print (numbers[])
        l = get length.
        for (i = 0 to l-1)
        {
            double num = numbers[i] * 2
            print (double num)
        }
    }

```

5. float Divide Elements (int val1, int val2)

```

{
    number 1 = val1
    number 2 = val2

    func divide
    {
        local num1 = number1
        local num2 = number2
        if (num2 != 0)
        {
            local quotient = num1/num2
            local remainder = num1 % num2
            print (quotient upto 2 decimal places)
            print (remainder)
        }
        else
        {
            print ("Division by 0 is not possible")
        }
    }
}

```

```
result = divide (number1, number2)
print (result)
```

```
}
```

6. int find Maximum element (int val1, int val2)

```
{
```

```
number1 = val1
```

```
number2 = val2
```

```
func maximum
```

```
{
```

```
num1 = number1
```

```
num2 = number2
```

```
if (num1 > num2)
```

```
{
```

```
print ("the maximum number is " num1)
```

```
}
```

```
else
```

```
{
```

```
print ("The maximum number is " num2)
```

```
}
```

```
}
```

```
result = maximum (number1, number2)
```

```
print (result)
```

```
}
```

7. str find Directory (str name)

```
{
```

```
dir_name = name
```

```
func directory
```

```
{
```

```
dir = dir_name
```

```

if (dir exists)
{
    print ("The directory exists")
    test dir
}
else
{
    print ("The directory doesn't exist")
    dir = new Directory ()
}
}

result
Directory (dir_name)
}

```

PRACTICE PROBLEMS

18th August

1. str check File exists (str name).

```

{
    print ("Enter the filename :")
    file_name = name
    if (file_name exists)
    {
        print ("File exists")
        if (file_name readable)
        {
            print ("The file is readable")
        }
        else
        {
            print ("The file is not readable")
        }
    }
    if (file_name writable)
    {

```

```

        print ("the file is writable")
    }
    else
    {
        print ("the file is not writable")
    }
}
else
{
    print ("File doesnot exist")
}
}

```

2. chr count lines words And Character (chr name).

```

{
    print ("Enter the filename: ")
    file_name = name.
    if (file_name exists)
    {
        lines = count no. of lines in file_name.
        words = count no. of word in file_name.
        characters = count no. of characters in file_name
        print ("Number of lines : " lines)
        print ("Number of words : " words).
        print ("Number of characters : " characters).
    }
    else
    {
        print ("File doesnot exists")
    }
}
}

```

3.

- (i) List contents of current directory
- (ii) Sort files in descending order of size using `ls -S`
- (iii) Take first file from the sorted list.
- (iv) Store it as largest file.
- (v) Print largest file.

19th August

4. `char findWordInFile (char word, char name)`

{

~~file~~

`file_word = word.`

`file_name = name`

`if (file exists).`

{

`search file_word in file_name`

`print (lines containing file_word)`

}

`else`

{

`print ("file doesnot exist")`

}

}

5. `int MultiplicationTable (int val)`

{

`number = val`

`for (i = 1 to 20)`

{

`result = number * i`

`print (number "x" i "=" result)`

}

}

6. chrn check Disk Usage (chrn current disk usage)

```
{  
  usage = Current Disk Usage  
  if (usage > 80)  
  {  
    print ("Warning: Disk usage above 80%")  
  }  
  else  
  {  
    print ("Current disk usage: " usage)  
  }  
}
```
